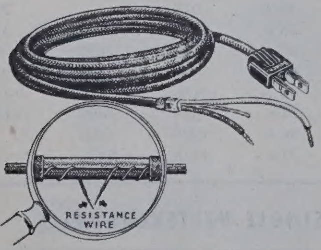
AC•DC resistance cord



To determine the proper ac-dc line cord, add the filament voltages of the individual tubes in the receiver. From the chart at right, select the nearest figure under the heading SUM OF TUBE VOLTAGES in the column headed by the available power supply. Length 6 ft. Size 18.

The consistent results obtained by the thousands of users of the JOHNSON Q antenna system are due to the extremely high efficiency of this famous antenna. Applications include half-wave doublet, either horizontal or vertical, harmonic or "long wire" radiator, radiator-reflector, radiator director, "V" Beam, JOHNSON Q Beam and others.

The JOHNSON Q Beam is a special application of the Q system. It consists of two half-wave Q antennas spaced 1-5 wave and Q sections connected in parallel at the bottom. In ordering specify two Q antennas for the lower frequency of the two bands desired. For example if you want a Q Beam to operate on 10 and 20 meters, order two JOHNSON Qs for 20 meters.

The -20Q and -6Q use aluminum tubing for the radiating portion as well as for the matching section. The 136-35 Jack Strip and 136-36 Plug Strip make an ideal feeder connection at the transmitter when the antenna is suspended.

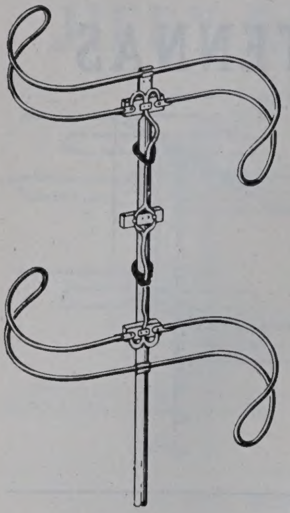
FM ANTENNAS



FM OMNIDIRECTIONAL ANTENNA TYPE 624

This antenna has nearly the same gain as a single dipole in the FM band, which is unique for an antenna of the non-directional type. Covers FM band with practically equal gain throughout, due to its 300-ohm impedance. Gain and band-width greater than that of turnstile antenna. For areas with less signal strength, the 624 may be stacked ½ wave-length between elements for maximum gain and minimum interaction. In a stacked array it is possible to peak the antennas for weaker stations.

CAT. No. 624—Omnidirectional Antenna. Consists of: 1 S-Type folded dipole with terminal panels; 1 5-foot aluminum mast; 2 mast insulators; 60-foot transmission line; 2 ribbon-type standoff insulators; 2 mast clamps; mounting screws. (Shipping Wt.: 4¾ lbs.) **List Price $11.00**

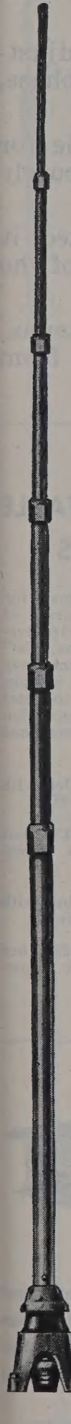
PREMAX Telescoping Vertical Antennas

Premax Adjustable Tubular Antennas have been widely used in radio fields for a long period of years and have shown exceptionally efficient, dependable performance under most severe climatic and shock conditions, both in continental United States and abroad. They are available in various lengths to meet all requirements, in monel, aluminum and steel. Mountings and insulators will be found on page S-48.



MONEL ANTENNAS FOR CORROSION RESISTANCE

Premax Monel Antennas have an outstanding combination of strength and corrosion resistance that is vital to trouble-free communications, whether at land or at sea . . . in the tropics or the arctics. The monel used in these Premax Antennas . . . two-thirds nickel and one-third copper . . . is twice as stiff as bronze, strong as structural steel. Yet it will not corrode or lose its strength in salt-water installations. Polished chrome-plated finish on all sizes.

Premax Monel Antennas are built up of multiple sections of hard-drawn monel tubing of a tensile strength exceeding 125,000 pounds per square inch. They are available in five standard units, fully telescoping and adjustable to any height between the minimum and maximum shown. The locking device employs a special knurled thimble and split friction clutch sleeve and holds the sections firmly at any desired height, also providing perfect electrial contacts.

ALUMINUM ANTENNAS FOR LIGHT WEIGHT

Premax Adjustable Type Aluminum Antennas are designed to provide light-weight with corrosion resistance and adequate strength to meet the most exacting conditions, for marine, mobile and commercial installations where convenience in erection and dependable performance are important considerations.

They are ideally adapted for use in radio telephone installations on fresh-water craft and commercial installations where convenience in extending and collapsing are important considerations.

These Antennas are built up of tubing that is specially drawn seamless tempered aluminum with diameters, gauges and temper engineered to withstand wind velocities up to 60 m.p.h. The locking device is simple and positive and provides low-resistance contact between sections. Six units are available, all fully telescoping.

HEAVY-DUTY NON-ADJUSTABLE

Another type for special installations under extraordinarily trying conditions is a Heavy-Duty, Non-Adjustable Aluminum Antenna in either 17½′ or 35′ length. This is a specially heat-treated Antenna designed to withstand wind velocities up to 100 m.p.h. The tubing is step-tapered from a base diameter of 2″ to a top of ½″ on the 35′ mast and a base of $\frac{31}{32}$″ to a top of ½″ on the 17½′ mast.

STEEL ANTENNAS FOR LOW COST

The low initial cost and general satisfaction of Premax Tubular Steel Antennas have made this equipment within all budget requirements for commercial, municipal, amateur and other types of installations. In construction these Antennas are made of high-tensile, copper-nickel steel tubing of carefully engineered diameters and wall thicknesses, heavily cadmium-plated and highly resistant to corrosion. When properly mounted, they will withstand all ordinary stresses without guying, but it is generally advisable to support them by guys or standoff insulators against abnormal winds or extreme strains.

Standard Premax Adjustable Tubular Steel Antennas are available in two, three, four, five and six-section models. All units are fully telescoping and adjustable within the lengths shown for the particular type. The locking device is simple in operation, positive in action and provides a secure and efficient electrical contact between the sections. While these Antennas possess unusual tensile strength, they are light in weight and easily portable. They have widespread use in fixed and mobile installations. NOT recommended for marine use on salt water.

CORULITE ADJUSTABLE ELEMENTS FOR ROTARY BEAMS

Premax Corulite Elements are designed to meet the need for lightweight but sturdy elements for use in horizontal arrays and similar applications. They are unusually light in weight and their special corrugated or reed design provides exceptional strength and rigidity so essential in horizontal types of installations. All parts are heavily electro-plated to provide corrosion resistance and high electrical conductivity. A positive clamp, spot-welded to the tubing, permits adjustment in length and assures rigid joints and positive electrical contact between the telescoping sections. Ease of adjustment between the two halves of each component element is provided by the Premax "Hairpin" Tuning Bar. By its use it is possible to have all of the elements set at a single physical length and the variation in their electrical length may be accomplished by the "Hairpin."

Corulite Elements are available in one, two, three or four-section units as shown in the specifications at the right. These elements meet all requirements for the various five to twenty-meter arrays in general use and are ideal for combinations in commercial, FM, television or amateur bands.

PREMAX Television and FM Antennas

Television transmitters emit horizontally polarized waves. However, near the receiving antenna, due to reflections from tall trees, buildings and other obstructions, there is bound to be a vertical component which, when combined with the horizontal component, will run the angle of polarization *somewhat above the original horizontal plane.*

Thus a "direct" and a "reflected" signal often combine at the receiving antenna and where an ordinary horizontal type dipole antenna is used this combination of signals produces only a minimum of desired signal *because one signal tends to cancel out the other.*

With the Premax Adjustable V Dipole Antenna the proper vertical or horizontal adjustment of the elements will correct this condition and make the two signals *combine* in phase, thereby *increasing* rather than reducing the received signal.

Premax dipole elements are designed to permit any desired adjustment of the angle for strongest reception (usually 35° to 45° above the horizontal plane) and they can be securely locked in the position deemed best.

Another feature of the Premax Adjustable V Dipole Antenna is that, properly mounted, it permits a *sufficient* signal energy *at the antenna terminals* to minimize the importance of the otherwise difficult task of perfect impedance matching.

Many leading radio engineers who have tested the Premax Adjustable V Dipole Antenna, mounted reasonably high and in the clear, find it insures *optimum reception* of signals from *all* of the TV stations which come within the line of sight.

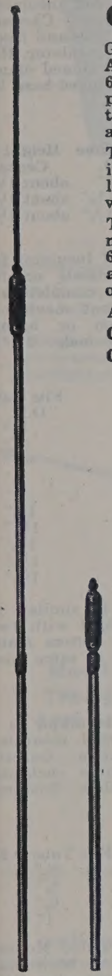
PREMAX Mobile and Police Antennas

CENTER-LOADED TUBULAR TELESCOPING MARINE ANTENNA



Center Loaded Antenna

Gives a remarkable gain over the signal produced by a base-loaded type of same overall length. At high-frequency end of its 2000 to 3000 kc range it gives a measured effective signal power of 6 decibels when compared with a base-loaded antenna of similar length. This is equivalent to that produced by quadrupling the transmitter power output. For example, with this new Antenna, a 10w transmitter will produce a signal equal to that of a 40w transmitter using a base-loaded antenna and tuning system.

The base of this Antenna presents such a low impedance that less loss is experienced with leaky base insulators due to icing, wet weather or water spray. The line feeding the base is a low impedance line and is not critical as to length and body-capacity effects as is the case of the base-loaded antenna where the loading coil is housed in the transmitter cabinet.

The Antenna consists of two telescoping, adjustable base sections on which the loading coil is mounted, with a tapered top whip section. Each tubular section and the top whip is approximately 6½′ long, providing a total extended length of about 19′. The base sections collapse to a single unit and the top whip section telescopes through the coil into the lower sections, making a collapsed length of only about 7½′.

Available in monel for salt-water installations or in aluminum for fresh water use.

Overcomes weaknesses and defects commonly found in other types! In this Premax, the coaxial line is grounded to same portion of mounting bracket that carries the antenna support itself. Hence no flexing of cable between ground and antenna connection.

A spring-tension joint permits entire antenna including insulator support and grounded cable to be deflected 90° without injury. Spring tension is sufficient to prevent accidental deflection.

Cadmium-plated steel bracket fits ¾″ tubing frame in either vertical or horizontal position as shown at right.

SERIES 2A — SUPER HIGH-GAIN SIX-ELEMENT ARRAY

This six-element array consists of two basic three-element antennas spaced a ½-wave apart and connected by a pre-assembled cable harness as an efficient "broadside array." The forward gain is 7.8 db. compared to the conventional ½-wave dipole and will produce a signal approximately six times as strong in power. The array is essentially single channel with an adjacent channel gain of 5 db. The high front-to-back ratio of 18 db. signifies that the possible response of an interfering co-channel signal arriving from behind the array would be 2% of that picked up from the front.

The sharp directional pattern combined with the advantages of shielded coaxial transmission line, means that the signal-to-noise ratio is considerably greater, and "snow effect" less, than that of other so-called fringe area antennas. In addition, "ghosting" is discouraged, even in city areas where multi-path reflections are numerous.

W-8, 52-ohm coaxial cable should be used as transmission line with this array. If a direct connection between the cable and receiver is not practicable, impedancewise, a W-100 adaptor together with a T-72 matching transformer and fittings may be necessary.

No mast equipment is supplied with this antenna yet mounting is extremely simple, since the clamp brackets furnished fit any 1¼-inch O. D. mast or 1-inch standard pipe. This feature along with "foolproof" assembly of the 2A antennas make installation very simple.

Preassembled Cable Harness Only

The installer can readily convert his present Series A, three-element antenna to a Series 2A, super high-gain, six-element array by adding another corresponding Series A antenna plus a cable harness. The performance of a high band (Channels 7 through 13) six-element Series 2A array can be further enhanced by stacking another Series 2A plus one more cable harness to make a very super high-gain twelve-element array. Details of these arrays are furnished with every Series 2A antenna.

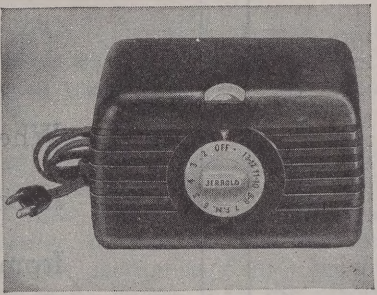
JERROLD TV-FM BOOSTER

Comes Equipped with the Amazing New, Built-in

MATCH-A-TRAN

Included At No Increase In Price



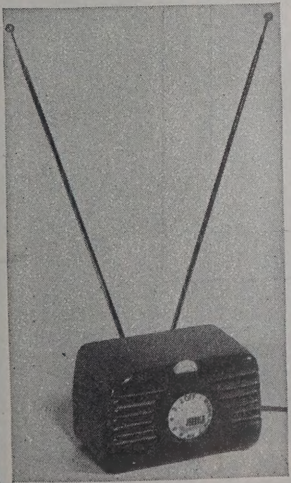
The Jerrold TV-FM Booster has been widely acclaimed for bringing better television reception to distant areas. Now, Jerrold makes another notable advance.

The Match-A-Tran is a new, variable step-impedence transformer that helps provide a perfect match between booster output and TV receiver—any receiver—on all channels. This assures that all the gain of the booster is delivered into the receiver. It is especially efficient on the high channels.

There Is A Difference

Yes, there is a difference between Jerrold and other boosters. Only Jerrold has a tuned-grid, tuned-plate circuit with a channel selector switch to select each channel. Only Jerrold gives a gain of 20 to 30 DB for the entire 6 megacycle bandwidth of each channel. Only Jerrold comes in a beautiful plastic cabinet. Only Jerrold has the Match-A-Tran. **Model TV-FM, $37.50 List**

JERROLD IN-TENNA



Indoor TV Antenna with Outdoor Antenna Gain

Jerrold In-Tenna combines an efficient indoor TV dipole with a high gain, wide band pre-amplifier. This combination offers a superior indoor antenna that is the perfect answer to TV installation problems in apartments, hotels, and private homes. Use it where an outdoor antenna cannot be installed and where an ordinary indoor antenna will not work satisfactorily.

The Jerrold In-Tenna is recommended as an indoor TV antenna, for use in any location up to 25 miles from the television transmitter. **Model TV IN, $42.50 List**

What is the MATCH-A-TRAN?

No present day receiver has an input impedence that is purely resistive for all channels. Thus, standing waves are present on all antenna lead-ins. These standing waves cause peaks and nulls of signal voltage to be spaced along the line at half wave length intervals for each frequency.

For best reception it is necessary that the receiver be connected at a peak signal point for each channel. In effect, the Match-A-Tran is an "electronic line stretcher" that can easily be adjusted for each channel. Thus, brighter, sharper pictures are obtained for all channels. Match-A-Tran is especially efficient on the high (7 to 13) channels.

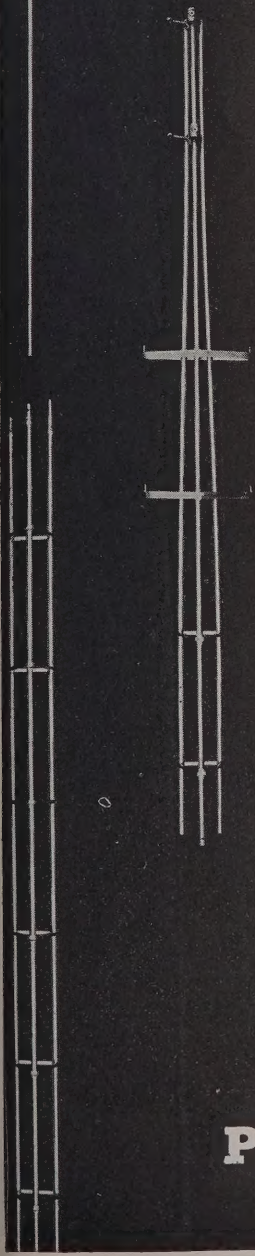
NEW *Teletower with*
EXCLUSIVE *Penn Pilot Hole*

So Foolproof . . . So Safe . . .
A Green Apprentice Can Zip it up Fast



2 Men Do the Job — Minimizes Wind Resistance . . . Reduces Vibration — Weighs Less Than 2 Pounds per Foot. Sectional Construction (in 10 foot lengths) — Saves Storage Space.

Penn Pilot Hole — Cuts Assembly Time 1/3.
(Patent Applied For)

Quick erection by the installer means quick profit for the wholesale distributor . . . that's the boiled-down truth about the new *Penn* TELETOWER.

Why? Because—at last— *a manufacturer has taken the trouble to engineer a simple mechanical feature that serves as a foolproof guide to speedier, safer tower erection.* One leg of the middle section in *Penn's* tripod-type tower is made longer than the others. Position this single leg correctly and — zip! — the other two are automatically brought into correct alignment.

As a result of this exclusive feature, *Penn* offers a tower with tripod stability that's as simply erected as a single pole. Two "green-hands" can put this tower up fast . . . and in safety!

When erected, this Penn Teletower forms a rigidly locked tripod that is unaffected by high winds and will not vibrate out of position. Yet, the entire assembly — built of lightweight steel — weighs less than 20 pounds. Sectional, prefabricated construction permits space-saving storage. Cross braces on tripod serve as rungs and make the tower a safe, useful ladder when erecting antenna. *Mount is so designed that not an ounce of tower weight rests on the motor!*

Penn Teletowers are already on the way "up"! . . . on roofs . . . and in sales! It will pay to drop us a line.

A profitable Penn Teletower connection in your territory may still be available — Though we anticipate heavy Distributor demand. Write or wire today. No obligation.

Wind-O-Loop

THE IDEAL APARTMENT HOUSE ALL CHANNEL TV & FM ANTENNA

WIND-O-LOOP is a completely novel approach to the problems affecting apartment house or restricted zone installation of television receivers. Constructed of a single rectangular loop and one di-pole, WIND-O-LOOP is attached to the pane of any window, indoors or out, by means of two rubber suction cups. The flat lead-in wire may be brought into the house over the top of the window sash and down behind the curtain or drape to the receiver, thus making the entire antenna invisible from the room.

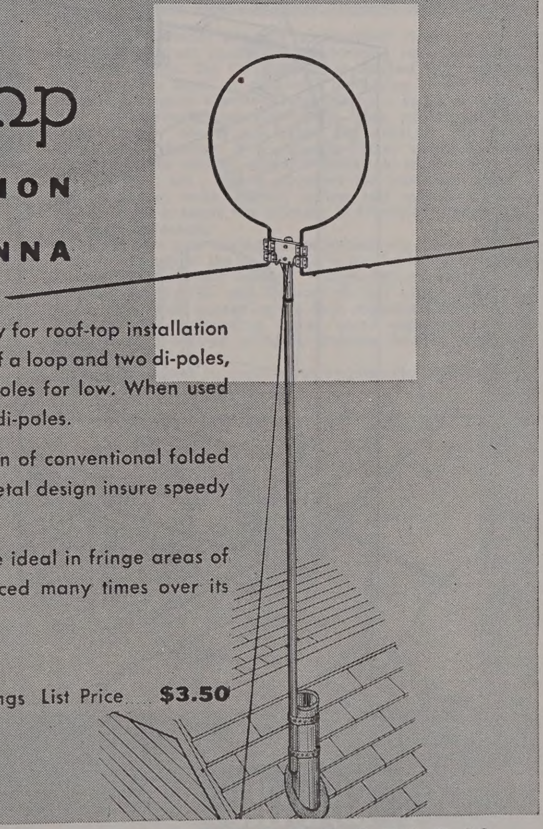
WIND-O-LOOP is packaged complete with twenty-five feet of lead-in, one end of which is already attached permanently to the antenna for greater convenience of installation. It is also provided with screws for use instead of the suction cups where installation upon a wood surface is desired. An all-channel antenna, WIND-O-LOOP may be oriented through 180° for maximum gain and may be permanently clamped in the most advantageous position. Since it is almost completely assembled upon delivery,

WIND-O-LOOP may be assembled and installed in three minutes or less by anyone. Complete with all necessary attachments and 25 feet of wire.

List Price.......................**$8.50**

Di-Loop

TELEVISION AND FM ANTENNA



DI-LOOP and all-channel TV and FM Antenna is intended primarily for roof-top installation and is packaged complete with an aluminum 6′ mast. Constructed of a loop and two di-poles, DI-LOOP uses the loop for high frequency reception and the di-poles for low. When used on low frequencies the loop acts as a resonated section for the di-poles.

DI-LOOP is a high-gain antenna, showing up to four times the gain of conventional folded di-pole antennas, yet its simplicity of construction and sturdy all-metal design insure speedy installation and a long life of excellent performance.

An excellent antenna in any area, DI-LOOP has been found to be ideal in fringe areas of reception where it has been found to out-perform antennas priced many times over its own low price.

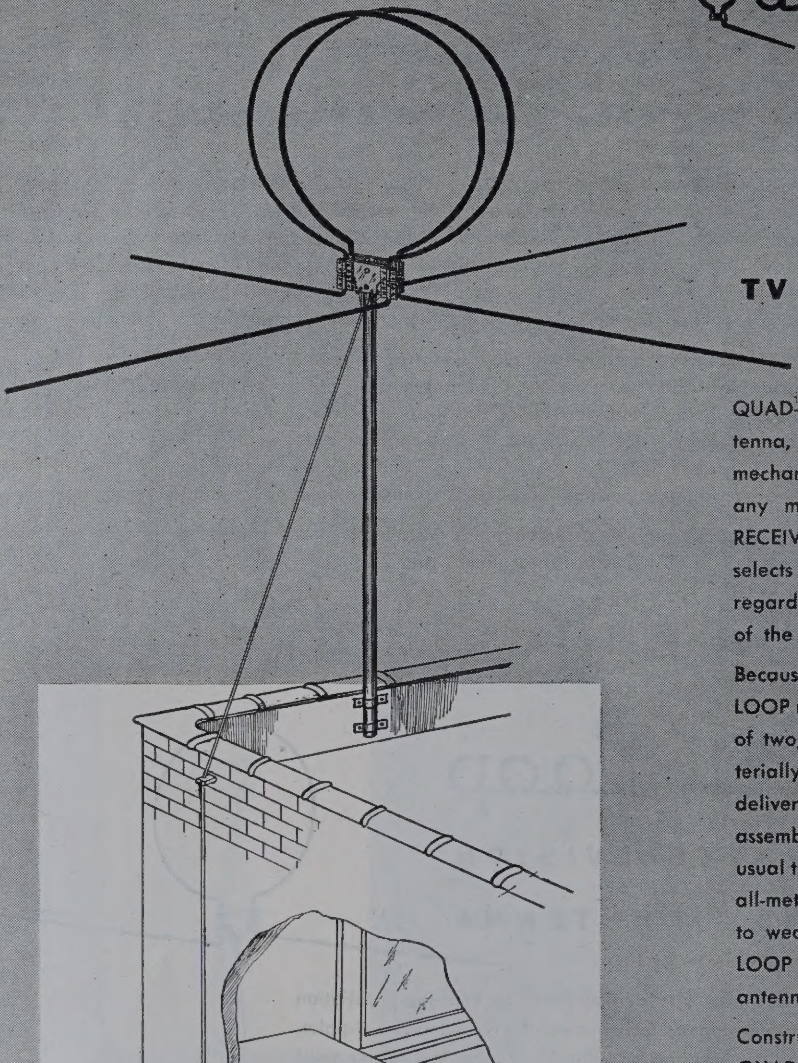
TV & FM ANTENNA



QUAD-LOOP, a quadrature-phasing antenna, achieves all of the advantages of mechanically rotated antennas without any moving parts. Controlled AT THE RECEIVER by a single knob, QUAD-LOOP selects maximum gain for each channel, regardless of the geographical location of the transmitting station.

Because it requires no orientation, QUAD-LOOP needs but one man to install instead of two, thus cutting installation costs materially. Ninety per cent assembled upon delivery, QUAD-LOOP may be completely assembled and installed in far less than the usual time required and because its sturdy, all-metal construction has no moving parts to wear or to become defective QUAD-LOOP will outlast mechanically rotated antennas without servicing or adjustment.

Constructed of two loops and four di-poles, QUAD-LOOP uses the loops for high frequency reception and the di-poles for low. When used on lower frequencies the loops act as resonated sections for the di-poles.

TECHNICAL NOTES

Telrex Conical Antennas technically and practically assume response characteristics similar to a solid conical cone, giving broad band and high gain response with full audio and video band pass over the entire television spectra.

The nominal center impedance is designed to be 150 ohms and is non-varying because of the conical shaped receiving dipoles. The receiving dipoles are tilted forward to present a "V" to the incoming wave, preventing the receiving lobe changing with increasing frequency, and narrowing the forward receiving lobe. Thus the Telrex receiving dipole is an effective ½ wave element on channel 2 increasing to ⅝ wavelength on channel 3 and increasing in effective "V" beam action to channel 13 where it has become a full wevelength on each leg with the maximum receiving lobe being in line. The reflectors are effective at all frequencies with a front to back ratio of better than 12 DB on all frequencies.

Unlike other methods of covering both bands, Telrex Antennas do not introduce phase shift or discriminate in favor of one band versus the other or one station versus another, and need only one transmission line. Closer to the stations at some locations it may be necessary to use another antenna because one or more stations are located too far either side of the receiving lobe. This antenna should have its own transmission line. Results can be obtained by connecting the antennas together, although this should be avoided as it may impair the reception on one or more stations. When the stations are within a 5 to 15 degree sector depending on distance from the transmitter the Telrex antenna used for maximum efficiency at low frequencies becomes a much more efficient antenna on the high frequencies than a separate cut-to-frequency stacked antenna.

The 2X-TV model presents a modified stacking of ⅛ wave with highest possible signal-to-noise ratio and minimum reflections. The 4X-TV model is stacked to present a spacing of ¼ wave on channel 2 increasing to full wavelength spacing on channel 13 lowering the angle of inception tremendously and eliminating high angle response lobes directly above and below the antenna. The gain effected by stacking is a variable factor depending on distance to the station, angle of radiation, season of year, time of day, etc., but it accounts for tremendous gain and minimizes noise, flutter, fading and reflections. The 8X-TV model presents the ultimate in television arrays with all band coverage.

The 150-ohm non-varying center impedance makes it possible to use any of the commercially available transmission lines whether 75-ohm coaxial, 90-ohm twin-ex or the unshielded variety 150- and 300-ohm ribbons with a standing wave ratio never exceeding 1.6 to 1 regardless of channel being received. Standing waves cause excessive phase-shift, causing blurred pictures, multiple images and decreased sensitivity.

You are invited to consult our engineering staff on any unusual antenna problems.

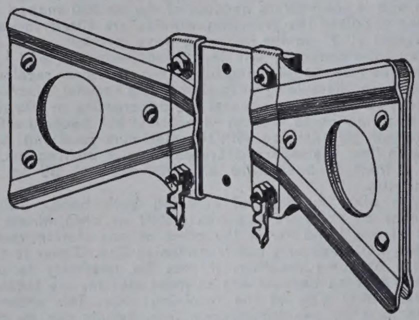
MECHANICAL NOTES

Telrex products are designed to minimize assembly time on the "job" assuring a considerable time-saving and a perfect mechanical installation.

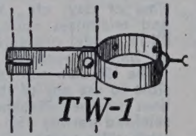


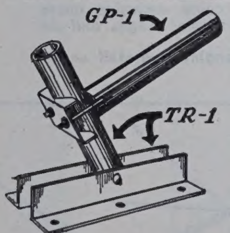
Telrex conical antennas are captivated within better than 3" of clamping action, providing better electrical contact over a longer period of time and a mechanical support that is second to none.

Mast or pipe clamps supplied are universal, allowing correct alignment and flexibility of mounting arrangements, from ¾" up to and including 1⅝" tubing.

The hardware in use is at all times the best money can buy overdesigned for the job.

Transmission Line Stand-off. Stainless steel banding and phenolic. Used on any size mast or tacked to the building to keep the transmission line away from the pipe or building. Durable; easily installed.





Gin Pole Accessory for use by the installer when a long mast is to be erected. Used in conjunction with the TR-1 (tilt-roof mount) makes erection of long masts a simpler task. Removed after installation for re-use.

Tilt-roof Mount, sturdily built of angle iron—easily mounted to roof—free action of mast for rotation and orientation.

Window Wall Set. A two-piece installation set for use where a roof installation cannot be made or where the roof overhang would interfere with mast being installed flush to the building.

Made of welded angle iron with a cross brace of steel wire. Paint-dipped, assures a lasting installation.

● The Alliance Tenna-Rotor is an antenna rotator designed to rotate the beam antenna in FM, Television and other high frequency radio applications. It consists of the rotator which is mounted on the antenna mast and a control box placed adjacent to the receiver.

The rotator unit, fully enclosed in a split zinc die-cast housing, is an electrically driven rotor — actually a rotating hollow shaft, into which the antenna center post is clamped. A four-conductor cable connects the rotator with a plastic control box which plugs into any 60-cycle 110-volt AC house circuit. A three-position selector switch controls the rotator. Throwing the switch to the right or left rotates the Rotor shaft clockwise or counter-clockwise through a complete arc of 365 degrees.

At the position of optimum reception, the switch is thrown to the center OFF position. Thus, Tenna-Rotor provides positive, instant control of rotation, enabling the operator to select the exact position for "peaked" reception! An automatic signal light illuminates a screen on the panel and tells when the limit of travel in either direction is reached. Tenna-Rotor is factory lubricated for life . . . designed for years of rugged service, works in any weather and the rotor unit resists corrosion. Tenna-Rotor reduces interference, expands the range and improves the performance of TV and FM installations. Amateurs can use it for transmission and reception with a special accessory thrust bearing (List Price $7.95 additional) which will handle most three element beams with a thrust load up to 200 lbs.

Fully approved and produced in accordance with Army-Navy specifications (JAN-C-17A). These specifications utilize the very fine dielectric properties of polyethylene, proven most efficient as a low-loss, flexible, mechanically stable dielectric. The outer jacket in most of Amphenol's approved types is tough, resistant vinyl . . . protective, nonhygroscopic, and impervious to exposure to acids, alkalis, oils and gasoline. Polyethylene is also used as outer jacket for some of the types listed.

Polyethylene is processed in strict accordance with Bureau of Ships Specification RE-9172. It should be emphasized that unusally strict standards are applied to every operation in the processing of Amphenol's RG cables. Rigid laboratory tests and process checks, plus Amphenol's "OK" certification and notarized affidavit on every unit shipment is final assurance of extra quality and dependability.

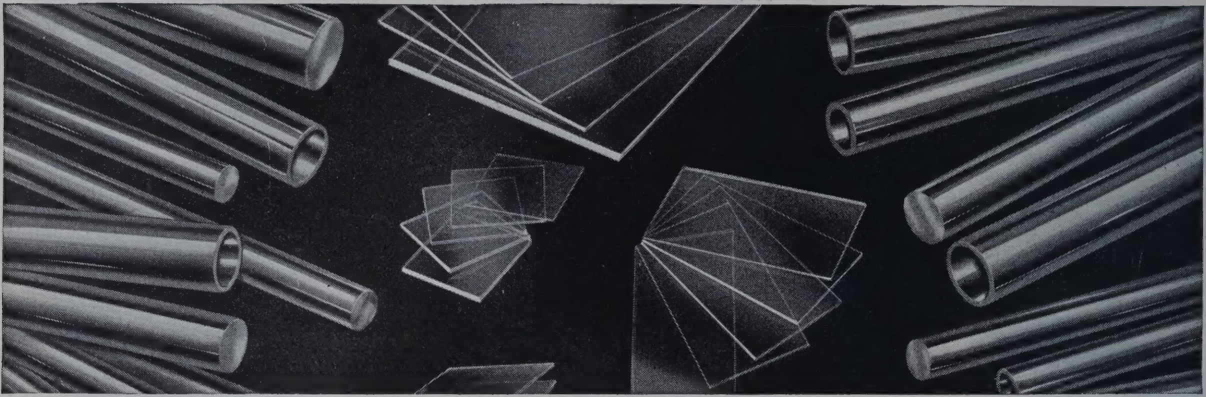
AMPHENOL AMERICAN PHENOLIC CORPORATION

Polystyrene, Polyweld and Coil Forms



BECAUSE of its low-loss factor, Amphenol POLYSTYRENE is used extensively for sockets, insulators and dielectrics in the very-high, ultra high and super high frequency fields. Further, it is colorless and transparent and does not deteriorate with age. Continuous exposure to sunlight affects its clarity only slightly.

Amphenol POLYWELD "912", colorless, transparent and ready-to-use, is pure polystyrene in solution. Matchless for "doping", coating, impregnating or sealing for radio frequency, ultrahigh frequency, very-high frequency or general electronics applications. Used as an adherent, POLYWELD joins two sections of polystyrene. It contains solvents which will actually "weld" the surfaces of polystyrene into a single unit of uniform tensile strength.

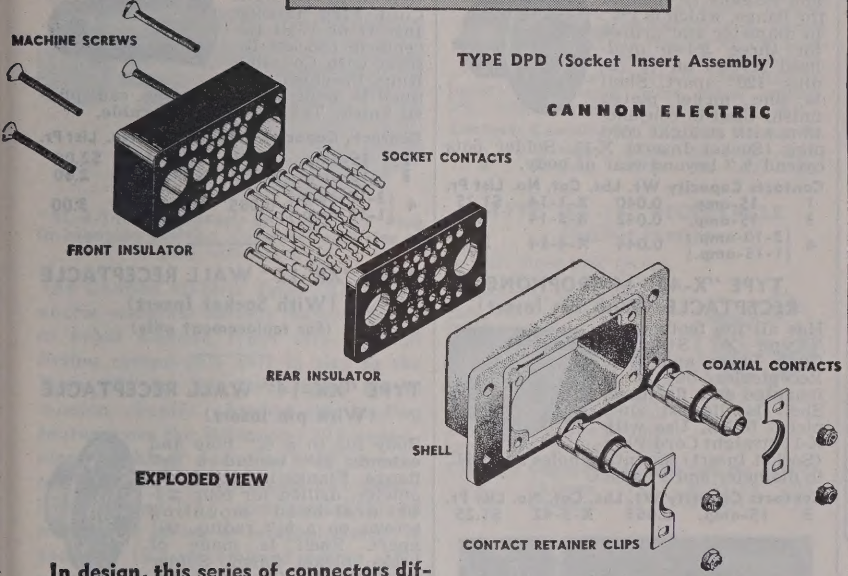
CANNON CONNECTORS

CANNON ELECTRIC DEVELOPMENT COMPANY • 3209 HUMBOLDT STREET, LOS ANGELES 31, CALIFORNIA

TYPE DP FITTINGS



TYPE DPD (Socket Insert Assembly)

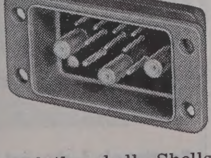
EXPLODED VIEW

In design, this series of connectors differs from the majority of Cannon Connectors. Type DP Fittings are rectangular in shape, and polarization is affected by the arrangement of the contacts within the connectors. A wide variety of contact arrangements is available with contacts ranging from 10-amp. to 40-amp. capacity and with low impedence Coaxial contacts of 10-amp. capacity providing for continuous shielding available in some types. Standard shells are aluminum finished in sand blast and clear lacquer; some types are available in zinc, sand blast and clear lacquer finished. Contacts are brass, silver-plated. Insulation is phenolic, with specially treated low moisture absorbtion ceramic insulation used in coaxal contacts. Leading uses of the Type DP connectors are in rack and panel instrument and radio equipment where weight and space saving are important factors. A BULLETIN ON DP CONNECTORS IS AVAILABLE ON REQUEST.

TYPE "DPD" RECEPTACLES
(With Socket Insert)

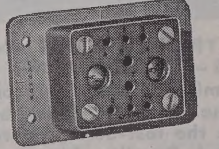
Mounting flange is 3⅜" x $1\frac{11}{16}$" and shell extends $\frac{29}{32}$" from the mounting surface forward Coaxial contacts extend $\frac{43}{64}$" to the rear from the mounting surface. Shells provide for mounting with four No. 6 oval head machine screws. Material is aluminum.

TYPE "DPD" PLUGS
(With Pin Insert)



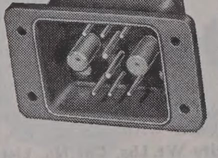
Mounting flange is 3⅜" x $1\frac{11}{16}$" and shell extends $\frac{1}{16}$" from the mounting surface forward and $1\frac{3}{64}$" from the mounting surface to the rear. The coaxial contacts extend $\frac{37}{64}$" from the rear of the shell. Shells provide for mounting with four No. 6 ovalhead machine screws. Material is aluminum.

TYPE "DPB" RECEPTACLES
(With Socket Insert)



The DPB Receptacles are similar to the Type DPD differing only in the mounting flange which is reduced to $2\frac{11}{16}$" x $1\frac{11}{16}$" shell material, zinc or aluminum. Standard coaxials with ceramic insulation. Six insert arrangements available, one having twinax contacts and two having coaxial contacts.

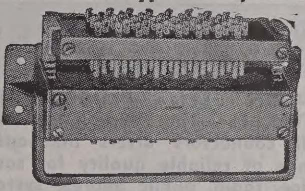
TYPE "DPB" PLUGS
(With Pin Insert)



The DPB Plugs are similar to the Type DPD, differing in the same respect as the DPB Receptacle differs from the DPD. They are mounted with four No. 6 Oval Head Machine Screws.

Standard finish on all DPB shells is tinplate and clear lacquer. Other finishes by special order.

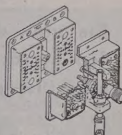
"DPR" Rack Type—Complete Unit



Four Insert Arrangements

Rack type fittings are used where large numbers of contacts must be repeatedly coupled and uncoupled, the coupling and uncoupling being performed by means of a geared movement operated by a bail type handle. The dimensions over all measure $5\frac{25}{32}$" x 3" x $2\frac{21}{32}$" (including swing of bail). Has four holes for No. 8 Mounting Screws.

TYPE DPD-2
Special Instrument Panel Disconnect



CUT-AWAY VIEW

The DPD2 has a two-gang shell holding 2 standard DPD inserts. Screw jack extraction means is available in straight or angle take-off. The purpose of the fitting is the standardization of such equipment so that it may be interchangeable between assemblies of various aircraft.

RNK

The Type "K" Series was designed especially for use in the aircraft field and is used almost universally for aircraft radio, instrument and electrical circuits. Although light in weight, units are rugged and durable. The "K" Series is made in 3 basic types: (1) Straight Type. (2) 90° Type. (3) Wall Mounting Unit, for which either straight or right angle junction shells are provided. Inserts of laminated and molded phenolic are removable.

The cable entry is regularly threaded for various sizes of aircraft flexible conduit, but there are fittings also available with cable clamp for special applications. The "K" Series is comprised of 8 diameters, with a great variety of contact arrangements covering a range of from 1 to 82 contacts, depending, of course, upon the diameter. 188 insert arrangements.

A key and groove arrangement makes it possible to connect fittings easily and quickly without the necessity of fumbling to match pins and sockets. This eliminates any possibility of forcing together in improper alignment and thus bending or breaking pins. Large contacts may be removed for soldering, thereby eliminating the possibility of damaging the insert with excessive heat.

Quick, easy access to solder pots at back of contact is made possible simply by removing either 3 or 4 Shakeproof Sems, depending upon the size of the fitting. Since these screws are equidistant, the barrel and insert may be rotated to accommodate 3 or 4 different positions. This is also true of the flanges on wall mounting units, making it easy to rotate these fittings to facilitate cable installation and avoid sharp bends in conduit.

Plugs and receptacles are locked together by means of a quick-acting threaded nut which holds both members firmly together and prevents shaking or accidentally pulling them apart. 10 to 250-amp. contacts.

CANNON "Type AN" Series of plugs and receptacles was designed especially to meet Army-Navy Specifications for aircraft electrical connectors. While the AN Series retains all the basic features of the Type K Series—features which have established conclusive proof of their effectiveness as applied to aircraft—numerous changes in design and construction have been made to conform to latest Army-Navy Specifications.

Type AN Plugs are made in three basic shapes or styles. These are: 1. Straight cord connectors. 2. Right angle or 90° cord connectors. 3. Flanged connectors for wall mounting. An almost unlimited combination of circuits and current capacities can be handled with AN connectors and their interchangeable inserts.

Removable and interchangeable inserts make it possible to change any fitting from a pin to a socket, or vice versa, and also to change the number of circuits handled through any fitting provided the inserts are of the same diameter. The split shell, a feature pioneered by Cannon, makes it easy to install wiring or to solder contacts.

An important feature of the Type AN Series is the means provided for coupling the members together. This consists of a coupling nut which serves to draw the parts together and to release them, while it also prevents plugs and receptacles from being jarred apart by excessive vibration. No special tools are required to lock or unlock plugs and receptacles, to separate split shells or to remove inserts. This feature is invaluable, since it eliminates delay in servicing in the field and also because there are so many combinations possible with Type AN Series.

"500" SERIES PLUGS AND SOCKETS

For Complete Listing of 500 SERIES, Write for No. 500 Catalog

Designed for 5,000 volts and 25 amperes per contact. Circuit characteristics, however, may alter this rating one way or the other.

Long leakage path from terminal to terminal, and terminal to ground. Contacts are brass and phosphor bronze, silver plated. Metal parts of caps and brackets are steel, parkerized (rust-proofed). Plug and socket blocks are interchangeable in caps and brackets.

All sizes are polarized in a manner to prevent a smaller plug being inserted in a larger socket. Thus different sizes may be used on one installation without danger of making wrong connections.

Extreme care has been taken to make terminal connections under cap very accessible both for original wiring and subsequent inspection. The cap is insulated with canvas bakelite. Plug prong cross section $\frac{5}{16}$" x $\frac{3}{32}$".

IMPORTANT: For safety with high voltages DEEP BRACKETS should always be used on one plug or socket, when the other plug or socket has a CAP. SHALLOW BRACKETS are for use only in connecting two units, each unit having plug or socket with SHALLOW BRACKET.

Cable entrance: Because of the great variation in type and size of cables, we have considered it best not to supply cable clamps of any kind. The cap end is made to accommodate standard BX clamps which may be obtained at any electrical jobbing house. The cap end will be furnished with round hole from ½" diameter and 1¼" diameter in steps of ⅛", if the size required is given on order. If no size is given, plain cap end with center punch locating center will be shipped.

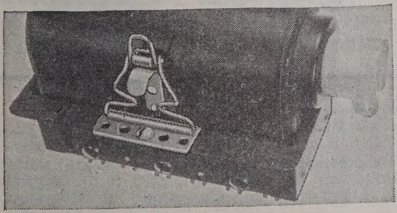
LOCKS FOR 500 SERIES PLUGS AND SOCKETS



Locks shown above are used in connection with any DEEP BRACKET and cap combination.

The locks securely hold the units together, but they can be released instantly.

The mounting plates are made to fit all DEEP BRACKETS, and are fastened by the same screws or rivets that hold the deep brackets to the panel. Can not be used on shallow brackets. Sold in pairs only.

1400 SERIES PLUGS AND SOCKETS

This series of "disconnect" plugs and sockets has the distinct advantage of low cost for a separate unit handling many circuits. Due to exposed metal parts, it is recommended for use when the complete unit is within a housing.

Reduces costs of servicing units. Advantageous in shipping when it is desirable to pack units separately. Polarized—assures correct coupling. Spring temper brass sockets assure perfect contact. Standard units are listed below from 5 to 16 contacts. However we can supply units having as many as 30 or more contacts.

On No. 1420 or larger we recommend the plug be divided into two or more units, as a single long plug is not mechanically strong. The socket will be made in one assembly.

No. 1410	(10 Contacts)	**Ea. .63**	**No. 1416**	(16 Contacts)	**Ea. .96**

For units with more than 16 contacts, add 6c to the No. 1416 price for each additional contact.

BARRIER TYPE TERMINAL STRIPS

Increased insulation is provided by having Barriers placed between each Terminal. These Barriers follow around the edge of the Strips and terminate at the base. They not only make a long leakage path but prevent direct shorts from frayed wires at the terminals. Mounting holes are at the ends as illustrated. The base is molded Bakelite.

The Terminals and Binder Screws are of brass, nickel plated. **Marker Strips** may be ordered and imprinted to supply terminal designations. These Marker Strips mount beneath Terminal Strips and also afford insulation from metal mounting surface.

For Right Angle Mounting

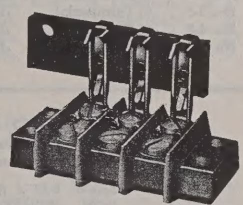

Illustration at right shows a No. 3-162 A-R Fanning Strip connected to a No. 3-142 Barrier Strip.

Jones Fanning Strip Terminals are of .032" Brass, Cadmium Plated. The Bakelite strips are furnished with a hole in either the right or left end for fastening the cable with a cable clamp or lacing twine. Simplifies cable or harness wiring, assuring positive connections. Makes replacement of units an easy matter and assures correct connections after servicing.

In many instances where there is not sufficient room for the standard Fanning Strips we can supply those listed formed for right angle mounting permitting use when Barrier mounts flush with the side of the chassis. Specify Series 160A, 161A and 162A instead of 160, 161 and 162. Prices slightly higher.

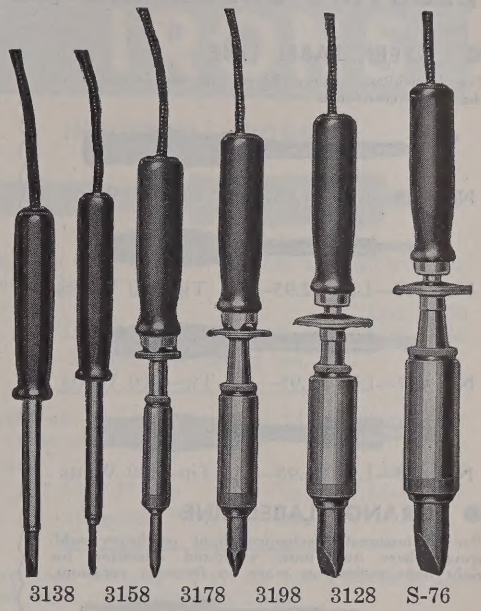
ELECTRIC SOLDERING IRONS

These Irons embody features that specialized experience—since 1894—has demonstrated to be desirable for efficient and lasting service. Hundreds of thousands in use throughout the world in manufacturing plants, service, maintenance and repair shops, Army and Navy Services, telephone, telegraph and radio stations.



No. 3138—Designed primarily for production and maintenance in radio, telephone, telegraph, ignition switchboard and telephone installation work and similar industrial applications.
No. 3158—For the same purposes as the No. 3138 but for work requiring an iron of greater capacity.
No. 3178—For use on still heavier work; for light commutators and service and production work. A very useful iron for general purposes.
No. 3198—For heavy work of all kinds. Supplies a large volume of heat at high temperature. Used by manufacturers in many different lines; for shop, service, production work, etc. Each of the above irons is equipped with a baffle plate, at the shank, to prevent free conduction of heat to the handle.
No. 3128—Designed for lighter work than the No. 3138 in similar applications. Has plug-type ¼"-diameter tip with a heating element of chrome nickel but without compression winding as used in the higher-wattage No. 3138-3198 series. Element and casing with handle springs and terminal assembly built as a unit.
No. S-76—Designed for work of the same kind as the No. 3128 but has a screw-type 7/16" diameter tip which screws on the metal head of the core of the chrome nickel heating element. Element with casing and handle springs and terminal assembly built as a unit.

Made in standard voltages and for 32 volts. No. 3138 also made for 6, 12, 24 and 55 volts. Nos. 3138-3198 can be equipped with three-conductor cord, one wire grounded, at slight additional charge. Separate heat-insulating stand supplied with each iron.

American Beauty COPPER TIPS

These copper tips are made from commercially pure, drawn bar, copper rod. Except for the No. 3734 screw-on type tip for the No. S-76 iron, each tip is designed to fit into, and to the full length of, core of heating unit of the particular iron for which it is intended. Maximum area of contact between the tip and heating unit is thus assured. Tips are of uniform diameted throughout their entire length. Each tip is held in place in core of heating unit by a recessed set-screw. Removal for cleaning or replacement is therefore easy. Standard shaped tips with which the various models are equipped are shown in the illustration; but pyramidal, instead of chisel type, and vice versa, can be supplied when so specified without additional charge. For No. 3138 a special, long, semi-chisel shaped tip No. 3738-S can be supplied for telephone and switchboard work.

American Beauty TEMPERATURE REGULATING STANDS

For use on (AC) Alternating Current Only

This is a thermostatically controlled device for the regulation of the temperature of an electric soldering iron while at rest. When placed on this stand, soldering iron is maintained at working temperature, ready for instant use or, if desired, at a lower temperature. Through an adjustment on bottom of the stand, thermostat may be set for the maintenance of any desired temperature—from very low, or warm, to full working temperature. Body of stand is of molded plastic. Soldering iron cradle proper is of metal. Stand is equipped with cord and attachment plug-cap for connection to current and with a receptacle for connection of the electric soldering iron. It is designed for use with electric soldering irons up to 660 watts capacity and on circuits up to 240 volts.

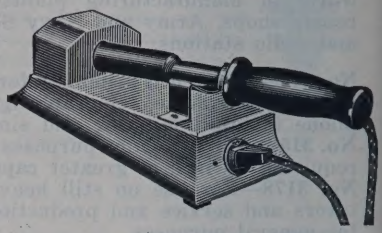
• Thermostatic Temperature Control Stand



The iron can be maintained at any desired temperature while in the stand. This is the only way to control the tip temperature of an iron. Control of element temperature is not satisfactory. There is too much of a lag between element and tip temperature.

Years ago we developed a thermostatically controlled iron, which regulated the element temperature (just as presently marketed thermostatically controlled irons do) but we discarded the iron as it would permit the tip to cool.

When the stand is properly adjusted, it is impossible for the iron to overheat or to burn off its tin.

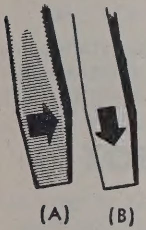
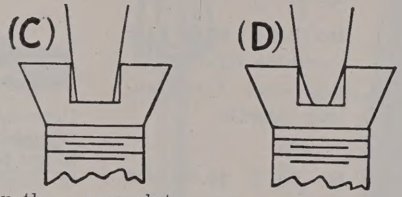
SHOCK-PROOF BREAK-PROOF AMBER PLASTIC HANDLE

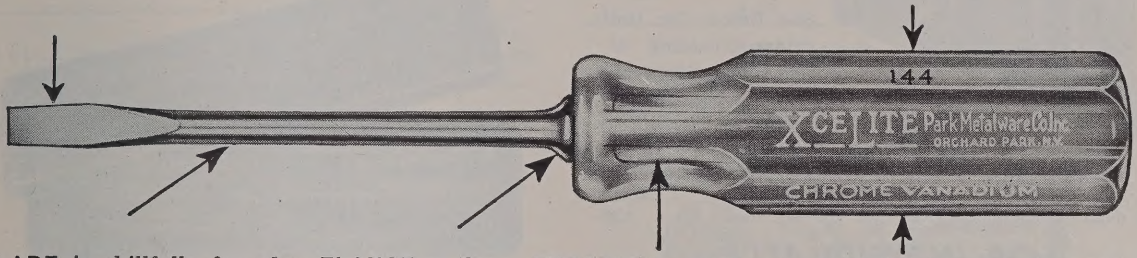
SCREWDRIVERS





TIP is properly ground and gauged to fit screw slot accurately. Ground on a flat belt grinder with grain running lengthwise with the blade "B" eliminates the indentations of crosswise grinding, always sources of tip weakness and breakage "A". XceLite grinding insures uniformity right down to the edge of the tip; insuring perfect fit in the screw slot. Note illustration "C" showing perfect rectangle of XceLite Tip, insuring grip in screw slot. Illustration "D" shows "dubbed-off" result of ordinary grinding with the tendency to lift out of the screw under turning pressure.

SIZE is clearly marked on the handle. Easier to select the correct size — easier to reorder. Number on handle is catalog number, also it gives size of screwdriver. For example: No. 144 means ¼" diameter blade; 4" long. Letters "R" or "S" signify round or square blade.



BLADE is skillfully forged of SAE 6150 Chorme Vanadium Electric Furnace Steel. Polished Blades.

FLANGE on the blade of handle resists shock of pounding.

EMBEDDED END of blade, winged design, prevents turning of the blade in the handle.

HANDLE is of genuine XceLite plastic, full size and correctly shaped for grip and balance.

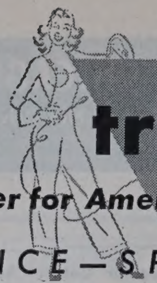
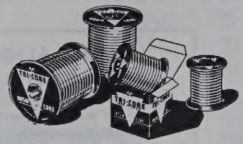
ALPHA tri-core solders



An American Solder for American Production Methods

INSURE PERFORMANCE—SPECIFY ALPHA TRI-CORE



TRI-CORE ROSIN-FILLED SOLDER

Craftsmen prefer this faster, easier sequence solder. It provides more uniform fluxing and stronger joints for Radio, Electrical, and Automotive work. Saves time, money and labor for manufacturing or repair service.

WHY TRI-CORE ROSIN-FILLED IS THE IMPROVED SOLDER:

- three independently filled cores assure flux continuity, eliminate risk of empty flux sections.
- thinner solder walls speed melting, cut soldering time by 25% or more.
- no activating chloride agent to produce acid conditions and toxic vapors.
- forms a clean, smooth, strong joint without carbonizing.
- three cores instead of one at no premium in price.
- all gauges from 1/4" and heavier down to 0.020" and finer.

TRI-CORE "LEAKPRUF" ACID-FILLED SOLDER

Why put up with old-fashioned, leaky acid-cored solders? Mechanics acclaim Tri-Core's cleaner job, long shelf life, and guaranteed leakproof feature. Now you can protect *yourself* as well as your reputation for better craftsmanship with this development in the field of acid-cored solders!

WIDELY PREFERRED FOR BETTER SOLDERING:

- The only three cored acid-filled solder.
- No solder waste due to fluxless areas.
- Highly soluble flux washes off with water.
- Non-toxic, and emits no offensive odors.
- Virtually non-sputtering, reduces hazards.
- Readily solders stainless steel, monel, nickel, etc.
- Leakproof; drip-proof; chalk-like flux will not leak to damage tools.
- The only acid core solder that can be formed into rings and other shapes, or cut to lengths without flux loss.

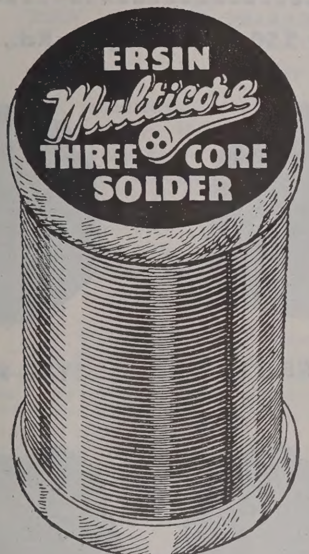
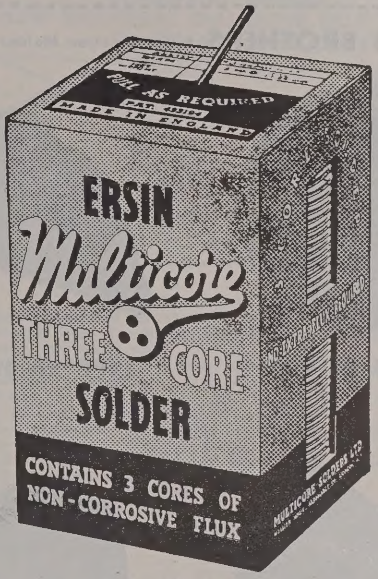
ERSIN MULTICORE SOLDER



SEVEN POUND REELS



ONE POUND CARTONS

ERSIN MULTICORE

The Solder containing 3 cores of extra active non-corrosive flux giving high speed soldering.

Our claim is a simple one: We believe that ERSIN MULTICORE is the finest cored solder in the World!

Ersin Multicore is solder in the form of wire containing three cores of non-corrosive Ersin Resin Flux. No extra flux is required. The use of Ersin Multicore guarantees that the correct proportion of flux to solder is used and maximum fluxing action occurs at the correct melting point of the solder. Only by using solder wire with three cores of flux is it possible to be sure the flux is always present—that there will not be lengths of wire without flux which result in "dry" or high-resistance joints.

In addition to this advantage, Ersin Multicore is the *only* cored solder in the world containing ERSIN, an extra-active non-corrosive flux. It is high grade rosin homogeneously activated by a process which confers on the rosin the vigorous fluxing action characteristic of the more active fluxes.

You enjoy speedy and a consistently high precision standard of soldering and attain just that extra rapidity which guarantees economy of operation. Ersin Flux not only removes surface oxides prior to soldering, but prevents formation during the soldering period. You can satisfactorily solder components which are highly oxidized—ones on which it would be necessary to undertake additional mechanical or chemical cleansing processes when using any other type of flux.

In Ersin Flux, the protective qualities of the original rosin are preserved. Joints made with Ersin Multicore Solder will not corrode even after prolonged exposure to any degree of humidity. The flux residue is impervious to moisture. It is hard and not sticky. It avoids accumulation of dirt and impurities on the joint.

Every reel or carton of Ersin Multicore is clearly marked both as to Gauge and Alloy, showing the actual content of Tin and Lead. You know exactly what you are getting when you buy Ersin Multicore Solder! Multicore costs a fraction more initially, but is unquestionably most economical in the long run.

Ersin Multicore Solder is available in all Tin/Lead alloys and in standard wire gauge from 10 to 22. (14, 16 and 18 s.w.g. are most popular.)

Ersin Multicore is the only solder which offers you these two fundamental advantages: (1) Multicore construction, providing three cores which assure perfect joints; (2) Ersin Flux, our *exclusive* fast non-corrosive flux.

Ersin Multicore is the answer for those who seek the finest Cored Solder in the World!

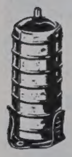
MINI-SHIELDS
The Perfect Shield For Mini-Tubes



These new Mini-Shields are formed to fit snugly and yet expand to a constant snug fit on larger tubes to automatically compensate for the considerable variation in physical dimensions of miniature tubes as commercially produced.

Specially shaped serrations spaced to engage the lower mini-shield ribs catch and hold the shield firmly which actually tightens against vibrations or other forces tending to jiggle the tube loose.

These shields are made so that three rows of dimples pressing against the tube provide a gentle but firm snug fit. The three prong spring base clip grips the shield positively, cradling the tube within the shield and retaining it firmly in the socket secure against vibration. These Mini-Shields are available in two sizes to accommodate tubes 1½″ long and 2″ long.

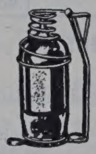
MINI-SPRING FOR MINI-TUBES
For Table Radios • Electronic Equipment
Radio Receivers



The Mini-Tube guard gives support to the Mini-Tube in two ways. It maintains a direct axial pressure downwards plus a sideways support that keeps the tube upright and perpendicular to the chassis. The spring action is constant and resilient permanently. If your radio equipment has an inclined chassis . . . or the tubes are mounted upside down or horizontally . . . or if it is subject to any vibration . . . or if your demand is constantly superior trouble-free reception, Mini-Tube guards are the only way to insure that tubes stay in place forever.

LAG SCREW EXPANSION SHIELD

This expansion shield is extensively used in television antenna installations. Made of a special alloy — 100% rust-proof. Newly designed threads hold greater load and external corrugations (ribs) give additional strength on masonry. This shield is 1″ long x ½″ O.D. and takes our standard ¼″ x 1¼″ lag screw.

No. 1230..........**$18.00 per C**

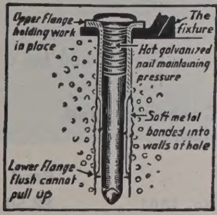
STUD ANCHORS

Stud Anchor consists of Cone-Headed Bolt, Lead Alloy Sleeve-Metal Cone and Square Nut completely assembled as at left. The bolt has two fins on its tapered section to lock into lead sleeve after the anchor has been set. This prevents the bolt from turning when the square nut is tightened Fits into a ½″ hole and is 2″ long over-all.

Instructions for Installation: Drill hole proper diameter and depth — place Star Stud in anchor into hole, head of the bolt first — remove the square nut — place setting tool or piece of pipe over bolt and hammer anchor solidly.

No. 1232..........**$18.00 per C**

DRIVE IN EXPANSION SHIELD



Upper flange holding work in place
The fixture
Hot galvanized nail maintaining pressure
Soft metal bonded into walls of hole
Lower flange flush cannot pull up

This is an expansion shield which uses **nails** as an expansion on locking pin. Drill ¼″ hole in the masonry and pass shield through mounting hole of object being attached so that top flange remains above fixtures. The nail, under the hammer blow, forces the lead into all the irregularities of the masonry hole, then passes through and locks anchor flange of bottom under the lead. The length of the shield is 1½″.

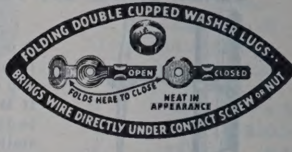
SOLDERLESS TERMINAL LUGS



FOLDING DOUBLE CUPPED WASHER LUGS
OPEN
CLOSED
FOLDS HERE TO CLOSE
NEAT IN APPEARANCE
BRINGS WIRE DIRECTLY UNDER CONTACT SCREW or NUT

These lugs are easily applied and do not require the use of any special tool. They are designed to give a trim appearance to an otherwise unsightly wire connection. They fold neatly over the stranding and confine it directly under binding screw or nut and automatically insure greatest possible contact. The cushion-like construction of these lugs, when closed, permits binding nut or screw to sink into the soft copper and so serves the purpose of a lock nut and is therefore vibration-proof. Packed 100 per box.

INSTRUCTIONS — FOR MEASURING BELTS

To determine size of belt, if the old belt is available, cut the belt and measure for stretched out length. This will be "cut length" of belt.

If old belt is not available or is worn out so that it cannot be properly measured, stretch a thin thread around belt pulleys on set. (Be sure to use thin thread as a thick cord will give an inaccurate reading.) Measure the thread, it will be our "circumference around pulleys." In measuring belts always remember that the **circumference around pulleys** is not the same as **stretched out or cut length.** A belt when cut, develops approximately 3/16" extra length when stretched out, depending on thickness of belt.
